Abstracts

The global Portable Heat Stress Monitor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A typical Portable Heat Stress Monitor may include various sensors to measure parameters such as ambient air temperature, relative humidity, radiant heat, and the individual's skin temperature. Some advanced models may also monitor the heart rate and core body temperature. Using these measurements, the monitor can calculate and display heat stress indices such as the Wet Bulb Globe Temperature (WBGT) index, which is commonly used to assess the risk of heat-related illnesses.

A Portable Heat Stress Monitor, also known as a Personal Heat Stress Monitor, is a handheld device used to measure and assess the level of heat stress experienced by an individual in a specific environment. Heat stress occurs when the body's ability to regulate its internal temperature is challenged due to exposure to high temperatures, high humidity, and physical exertion. It is an important tool in occupational safety and health, as it helps to prevent heat-related illnesses and ensure the well-being of workers in hot and humid working conditions.
