## Abstracts

According to our (Global Info Research) latest study, the global Portable Light Field Cameras market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A Portable Light Field Camera is that uses a single camera and a single master lens to obtain both a 2D image and measured and calibrated 3D depth of field information in a single shot. The principle of the composition of this camera is to add a special micro-lens array between the main lens of the camera and a high-quality sensor. Through the refraction of the lens, the image of the scene can be focused in front of the micro-lens array, through which the micro-lens will be re-imaged to the image gathered here and projected to a high-quality image sensor. The camera does not process internally, the vision outputs the raw image to a PC, and the GPU processes the raw image to obtain 2D and 3D data.
