Infrared thermal imager is a device that uses infrared thermal imaging technology to convert the thermal distribution data of the target object into a video image by measuring the infrared radiation of the target object, through photoelectric conversion, signal processing and other means. The specific working process of the infrared thermal imager is to receive the infrared radiation energy of the measured target through the optical imaging system, and then apply it to the photosensitive element of the infrared detector, and obtain the infrared thermal image after the subsequent circuit and signal processing. Its essence is to image the energy in the infrared band, and then through pseudo-coloring processing, different colors represent different temperatures, so as to intuitively see the temperature distribution on the surface of the object. Moreover, the infrared thermal imager can not only realize non-contact temperature measurement, but also the measurement accuracy can be controlled within $\pm 0.2^{\circ}\text{C}$.
