The global Portable Optical Magnifier market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A portable optical magnifier is a handheld device that is designed to magnify and enlarge the viewing field. It usually consists of convex or concave lenses and is widely used in various industries, including medical, industrial, scientific, and everyday life. They are typically designed to be lightweight, easy to carry and use, for when a detailed view or magnification of an image or text is required. These lenses typically have different magnification ratios and focal lengths to meet the needs of different applications. They can be used to observe cells, insects, jewelry, stamps, maps, handwritten fonts, and more. The main working principle of a portable optical magnifier is to magnify light through the lens, making it easier for the human eye to observe the magnified image of an object.
