According to our (Global Info Research) latest study, the global Portable Vacuum Thermos Tumblers market size was valued at US\$ 2264 million in 2025 and is forecast to a readjusted size of US\$ 3149 million by 2032 with a CAGR of 4.9% during review period.

Portable vacuum thermos tumbler is generally made of stainless steel and vacuum layer made of water container, the top has a lid, sealed tightly, vacuum insulation layer can make installed in the internal liquid such as water to slow down heat dissipation, in order to achieve the purpose of heat preservation.

The vacuum flask consists of two vessels, one placed within the other and joined at the neck. The gap between the two vessels is partially evacuated of air, creating a partial-vacuum which reduces heat conduction or convection. Heat transfer by thermal radiation may be minimized by silvering flask surfaces facing the gap but can become problematic if the flask's contents or surroundings are very hot; hence vacuum flasks usually hold contents below the boiling point of water. Most heat transfer occurs through the neck and opening of the flask, where there is no vacuum. Vacuum flasks are usually made of metal, borosilicate glass, foam or plastic and have their opening stoppered with cork or polyethylene plastic. Vacuum flasks are often used as insulated shipping containers.
