## Abstracts

The global Portable Wireless Charging Power Bank market size is expected to reach \$ 13580 million by 2029, rising at a market growth of 17.4% CAGR during the forecast period (2023-2029).

Wireless mobile power refers to equipment and devices with built-in batteries, which obtain power through wireless induction for charging. Wireless charging technology originates from wireless power transmission technology. Its working principle uses the principle of induction cooker. When the current passes through the coil, a magnetic field will be generated; and the generated magnetic field will form a voltage. After the voltage, a current will be generated. With the current, it can be charged, and now this technology has been used in wireless mobile power. Wireless charging, also known as inductive charging and non-contact inductive charging, uses near-field induction, that is, inductive coupling, to send energy from the power supply device (charger) to the device that uses the power, and the device uses the received energy to charge the battery and simultaneously used for its own operation. Basically, because the charger and the power-consuming equipment transmit energy through inductive coupling, there is no need to use wires to connect the two, so both the charger and the power-consuming equipment can have no exposed conductive contacts. That's more convenient than wired charging. A mobile power supply is a portable charger that can be carried around, can store electric energy, and is mainly used for charging consumer electronic products (such as mobile phones, laptops) such as handheld mobile devices. It is especially used in occasions where there is no external power supply. Its main components include: a battery for electric energy storage, a circuit for stabilizing the output voltage (DC-DC converter), and a charger circuit for charging the built-in battery. The emergence of mobile power comes from the emergence of smart phones, which are much more powerful than their predecessors, and the frequent use of users causes a sharp

increase in power consumption.
