The camera consists of a detector, a signal processor, and a display unit. The detector is usually a scintillator or semiconductor detector, which is sensitive to gamma rays. The signal processor processes signals from the detector and converts them into visible images on the display unit. The display unit displays gamma ray images in real-time, allowing users to locate and identify radiation sources. portable ? The camera is usually used for nuclear medicine, environmental monitoring and emergency response. They are particularly useful for detecting and locating radiation sources in areas with limited access or inability to use larger imaging systems.
