The global Portable ? Camera market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

portable ? A camera is a handheld device used for gamma ray imaging. It is a radiation detector that can detect and locate gamma ray sources within a given area. The working principle of this device is to detect gamma rays emitted by radioactive substances and convert them into visible images on the screen. portable ? The camera consists of a detector, a signal processor, and a display unit. The detector is usually a scintillator or semiconductor detector, which is sensitive to gamma rays. The signal processor processes signals from the detector and converts them into visible images on the display unit. The display unit displays gamma ray images in real-time, allowing users to locate and identify radiation sources. portable ? The camera is usually used for nuclear medicine, environmental monitoring and emergency response. They are particularly useful for detecting and locating radiation sources in areas with limited access or inability to use larger imaging systems.
