Abstracts

The global Positional Tracking market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Positional tracking is a technology that allows a device to estimate its position relative to the environment around it. It uses a combination of hardware and software to achieve the detection of its absolute position. Positional tracking is an essential technology for virtual reality (VR), making it possible to track movement with six degrees of freedom (6DOF). It has to be noted that head tracking is not the same as positional tracking. While head tracking only registers the rotation of the head (Rotational tracking), with movements such as pitch, yaw, and roll, positional tracking registers the exact position of the headset in space, recognizing forward/backward, up/down and left/right movement. Positional tracking VR technology brings various benefits to the VR experience. It can change the viewpoint of the user to reflect different actions like jumping, ducking, or leaning forward; allow for an exact representation of the user's hands and other objects in the virtual environment; increase the connection between the physical and virtual world by, for example, using hand position to move virtual objects by touch; and detect gestures by analyzing position over time. It also applies in augmented reality (AR).
