A Positive Displacement Rotary Gear Pump is a type of pump that transfers fluid through the mechanical movement of gears within a chamber. This pump operates by using two interlocking gears—one driven by a motor and the other driven by the first gear—to trap and move a fixed volume of fluid with each rotation. As the gears turn, fluid is drawn into the pump through an inlet port, captured between the gear teeth, and then expelled through the outlet port, creating a steady and consistent flow. The 'positive displacement' characteristic means that the pump moves a precise volume of fluid with each gear rotation, regardless of the fluid pressure or viscosity, making it highly effective for applications requiring accurate and reliable fluid transfer. Positive displacement rotary gear pumps are widely used in industries such as chemical processing, oil and gas, and manufacturing, where they handle various fluids, including viscous, abrasive, and corrosive substances. Their design ensures consistent flow rates and pressure, making them essential for precise fluid handling and control in demanding operational environments.
