Positive photoresist developer for LCD is a chemical solution specially used for developing photoresist in the manufacturing process of LCD. In the LCD manufacturing process, the developer is used to remove the photoresist in the exposed area to achieve the patterning function. In the photolithography process, when the positive photoresist is exposed to ultraviolet (UV) or other light sources, the photoresist in the exposed area will undergo chemical changes, making it soluble in the developer. Through the action of the developer, the photoresist in the exposed area can be removed, leaving the photoresist in the unexposed area, thereby achieving the desired patterning effect.
