Abstracts

The global Positive Photoresist Remover market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Positive photoresist is a material used in lithography processes in microelectronic manufacturing. It usually requires steps such as photolithography, exposure, and development to form fine patterns. During the photolithography process, there may be some defective patterns or residual photoresist, which requires the use of a positive photoresist remover to remove. Positive photoresist remover is usually an organic solvent that can effectively remove positive photoresist. However, the following points should be noted: positive photoresist remover should be fully compatible with the photoresist to be removed, otherwise it may cause damage to the device. When using positive photoresist removers, corresponding safety operating procedures should be followed, such as wearing gloves, masks, etc. The use method and dosage of positive photoresist remover should be adjusted according to the specific situation to avoid damage to the device. When using positive photoresist removers, a well ventilated environment should be maintained to avoid the accumulation of harmful gases. It should be noted that positive photoresist removers are usually an organic solvent that may be harmful to human health. They should be used in a well ventilated environment and corresponding protective measures should be taken. If you are unsure which remover to use, you can consult the manufacturer or a professional.
