Abstracts

The global Positive Pressure Helium Detector market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Positive pressure helium testing machine is a testing equipment used in the lithium-ion battery industry, mainly used to test the sealing performance of batteries. Lithium ion batteries need to be sealed during the production process to ensure that the electrolyte inside the battery does not leak, and to prevent external oxygen from entering the battery, thereby ensuring the safety and performance of the battery. The positive pressure helium detector tests the sealing performance of the battery by placing it in a sealed testing chamber and injecting a certain pressure of helium gas, using the low permeability and high sensitivity of helium gas. If the sealing performance of the battery is good, helium will not leak or penetrate into the interior of the battery; If there is a problem with the sealing performance of the battery, helium gas will leak or penetrate into the interior of the battery, which will be detected by the testing equipment. The positive pressure helium detector can evaluate the sealing performance of batteries by detecting parameters such as helium leakage rate and permeability, and screen and eliminate unqualified batteries. This can ensure that the produced lithium-ion batteries have good sealing performance, improving the safety and reliability of the batteries.
