Abstracts

The global Positive-pressure Hood Sterilization Chamber market size is expected to reach \$ 10.21 million by 2032, rising at a market growth of 6.6% CAGR during the forecast period (2026-2032).

In 2025, global sales of Positive-pressure Hood Sterilization Chamber reached approximately 120?170 units, with an average market price of about USD 35,000?55,000 unit, an annual production capacity of roughly 150?190 units, and an industry-average gross margin of approximately 25%.

A Positive-pressure Hood Sterilization Chamber is a dedicated enclosed equipment system designed for the controlled decontamination, disinfection, sterilization-supporting treatment, sterile storage, and in some configurations charging management of positive-pressure protective hoods, PAPR hoods, and similar powered respiratory headpieces used in high-containment biosafety laboratories, animal research facilities, disease-control laboratories, vaccine R&D platforms, and pathogen-handling environments. The equipment typically integrates a stainless-steel sealed chamber, hood hanging or positioning fixtures, vaporized hydrogen peroxide or other gaseous decontamination generation modules, optional ultraviolet assistance, controlled airflow circulation, catalytic aeration, residual monitoring, leak-tightness control, automated cycle programming, and safety interlocks. Its primary function is to treat both the inner and outer surfaces of reusable protective hoods and associated contact areas under a validated and repeatable chamber process, thereby reducing cross-contamination risk during reuse management in BSL-3, ABSL-3, and other high-biosafety operating environments.
