## Abstracts

According to our (Global Info Research) latest study, the global Positron Emission Tomography and Computed Tomography market size was valued at USD 1544.5 million in 2022 and is forecast to a readjusted size of USD 3903.6 million by 2029 with a CAGR of 14.2% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Positron Emission Tomography and Computed Tomography (PET/CT for short) is a high-end medical device for functional and anatomical imaging of the human body and its organs. It is suitable for whole body or local tumor examination, Cardiovascular system examination and brain nervous system examination. PET/CT can complete two image scans at the same time. PET images are molecular images of cell metabolism, showing the functional status of cells and organs, but cannot accurately locate the specific anatomical structure of diseased tissues. CT images are structural imaging, which can effectively display the anatomical structure of the human body. PET/CT combines the functional imaging of PET with the images of CT anatomical structure imaging, giving full play to their respective advantages, and has unique value in the qualitative and localization diagnosis of tumors, clinical staging, evaluation of curative effect, finding of metastases and monitoring of recurrence. .
