Abstracts

The global Positron Emission Tomography and Computed Tomography market size is expected to reach \$ 3903.6 million by 2029, rising at a market growth of 14.2% CAGR during the forecast period (2023-2029).

Positron Emission Tomography and Computed Tomography (PET/CT for short) is a high-end medical device for functional and anatomical imaging of the human body and its organs. It is suitable for whole body or local tumor examination, Cardiovascular system examination and brain nervous system examination. PET/CT can complete two image scans at the same time. PET images are molecular images of cell metabolism, showing the functional status of cells and organs, but cannot accurately locate the specific anatomical structure of diseased tissues. CT images are structural imaging, which can effectively display the anatomical structure of the human body. PET/CT combines the functional imaging of PET with the images of CT anatomical structure imaging, giving full play to their respective advantages, and has unique value in the qualitative and localization diagnosis of tumors, clinical staging, evaluation of curative effect, finding of metastases and monitoring of recurrence. .
