According to our (Global Info Research) latest study, the global Post CMP Brushes market size was valued at US\$ 77.17 million in 2025 and is forecast to a readjusted size of US\$ 131 million by 2032 with a CAGR of 7.8% during review period.

Post CMP brushes are critical precision consumables used in the scrubbing and cleaning stage after wafer chemical mechanical polishing. Their core role is to remove slurry residue, particles, metal ions, and other post CMP defect sources without introducing additional scratches or contamination, thereby improving yield, stabilizing wafer to wafer consistency, and shortening equipment changeover and startup time. Based on the official product pages reviewed in this round, the mainstream technology route centers on high purity porous PVA and PVA sponge materials, with performance optimization built around integrated cores, molded through the core construction, air foaming, surface nodule structures, porosity and pore size control, low extractables and low ionic contamination, and chemical preservation systems. Typical customers include semiconductor manufacturers serving logic, memory, VNAND, advanced process nodes, and other precision electronic applications with very high cleanliness requirements. Products are commonly delivered by eight inch and twelve inch configurations, different outer diameters, inner diameters and lengths, different OEM tool interfaces, and different cleaning conditions, while customized design and localized technical support are also available. Commercially, this category is mainly sold as a recurring consumable, and competition focuses on cleanliness, defect control, service life, break in time, tool compatibility, supply reliability, and service responsiveness. At the same time, some suppliers are beginning to include water saving, lower dummy wafer consumption, and reduced downtime in their broader value proposition.

Post CMP brushes are not ordinary cleaning accessories, but process grade consumables that directly affect post CMP defect control on wafers. Based on the official descriptions from Entegris, Rippey, Purience, and AION, the market does not evaluate them by cleaning capability alone. Instead, it focuses on particle release, trace metal contamination, wafer to wafer uniformity, break in time, brush concentricity, pore size and porosity stability, liquid transmission efficiency, and tool changeover efficiency. In other words, the real value of this product lies in helping fabs convert the cleaning step into more stable yield outcomes while reducing repeated tool adjustments and scrap caused by brush eccentricity, contamination release, or cleaning instability. Product pages from Entegris and Rippey already position low particle levels, low metal contamination, shorter flush up and break in, and higher tool utilization as core selling points, while Purience and Cenefom bring moisture absorption, pore size, chemical resistance, water saving, and reduced dummy wafer usage to the forefront. This indicates that the market has moved beyond whether a brush can clean and is now asking whether it can deliver cleaning with lower defectivity, lower total cost of ownership, and higher process stability. As defect tolerance continues to tighten in advanced logic, VNAND, and other high cleanliness manufacturing steps, post CMP brushes are being upgraded from traditional consumables into key components closely tied to yield management, equipment utilization, and process window control. Procurement decisions are therefore likely to become increasingly driven by quantifiable quality metrics and long term process capability rather than simple price competition.

From a competitive standpoint, this segment shows the classic characteristics of a small but specialized market in which technical capability and regional substitution advance in parallel. Companies in the United States and Japan have deeper advantages in high purity material processing, low ionic contamination control, mature OEM adaptation, and long term customer validation, while suppliers in South Korea, mainland China, and Taiwan are more clearly strengthening local delivery, cost efficiency, custom development, and response speed. Official product pages also show that competition is no longer about whether a company can make a PVA brush roller. It is increasingly about who can better control foam structure, preservation systems, integrated core construction, surface nodule design, and compatibility across different tool interfaces. In an environment where mainstream platforms such as AMAT, Ebara, and OnTrak remain deeply entrenched, once a product is qualified, later replacement usually carries a high validation threshold. As a result, early qualification, supply stability, and field service continue to magnify supplier advantages. Coastal PVA emphasizes Bonded on the Core and custom manufacturing, AION highlights more than sixty years of PVA materials expertise, GMC stresses localization and cost effectiveness, and Cenefom under BenQ Materials differentiates through air foaming, one piece construction, and high

compatibility. This suggests that the market is forming a two tier structure in which established international suppliers defend the high validation segment while Asian regional suppliers accelerate penetration through localization and service based competition. For later entrants, localization still offers opportunity, but the real determinant of share gains will be whether cost advantages can be converted into equivalent cleanliness, service life, and defect control performance.

The medium to long term outlook for the industry is relatively optimistic because demand growth, policy support, and sustainable manufacturing are all acting at the same time. SEMI expects global front end fab equipment investment to reach 110 billion dollars in 2025 and rise further to 130 billion dollars in 2026. AI driven growth in logic, memory, and edge device silicon content is a key driver, which means the demand base for CMP and post cleaning consumables is still expanding. At the same time, CHIPS for America in the United States, the European Chips Act, and South Korea's semiconductor ecosystem support package are all promoting domestic manufacturing, advanced packaging, and supply chain resilience. This will create more opportunities for consumable suppliers that can provide stable quality and regional service. Combined with the fact that some suppliers are now highlighting water savings, lower dummy wafer consumption, and lower carbon emissions, post CMP brushes are gradually taking on a triple role as a yield tool, a cost reduction tool, and an ESG tool. Based on the screened supplier list used in this round and the official locations of those companies, supply is already distributed across the United States, Japan, South Korea, mainland China, Taiwan, and Malaysia, while sales demand is likely to continue expanding in line with fab investment across China, South Korea, Taiwan, the United States, Japan, and Europe. For suppliers, future growth will come not only from advanced nodes, but also from mature node expansions, regional backup supply chains, stronger customer demand for reduced downtime, and the revaluation of cleaning consumables as part of broader process optimization and ESG assessment systems.
