According to our (Global Info Research) latest study, the global Post-Dry-Etch Residue Remover market size was valued at US\$ 226 million in 2025 and is forecast to a readjusted size of US\$ 341 million by 2032 with a CAGR of 6.3% during review period.

Post-dry-etch cleaning solutions refer to specialized wet-process chemicals used in semiconductor manufacturing to remove residual photoresist, polymer sidewall residues, and inorganic contaminants from wafer surfaces following the completion of dry etching processes.

The upstream segment of the post-dry-etch cleaning solution supply chain primarily comprises electronic-grade solvents, ultra-pure water, fluoride/organic acid/amine-based systems, chelating agents, and corrosion inhibitors; this segment places stringent demands on the purity of raw materials. The midstream segment consists of manufacturers of functional wet electronic chemicals, whose core competencies lie in formulation design, process compatibility with customer equipment, and mass production validation. The downstream segment primarily finds application in the removal of residues following dry etching and ashing processes within wafer fabrication and advanced packaging operations.

By 2025, global sales volume is projected to reach approximately 10,000 tons, with market selling prices typically ranging from \$15 to \$35 per kilogram. The industry's gross profit margin generally falls within the range of 35% to 55%.
