The global Post-Emergent Weed Killer market size is expected to reach \$ 415 million by 2032, rising at a market growth of 6.0% CAGR during the forecast period (2026-2032).

Post-emergent weed killers are a type of chemical herbicide that is applied after weeds emerge and grow. They are used to kill weeds that have already germinated and are visible. They are often used for weed management in crop fields, gardening land, and non-cultivated areas. They are absorbed into the plant body through the leaves, interfering with the photosynthesis, protein synthesis, or hormone regulation system of the weeds, and ultimately leading to plant death. According to different selectivity, post-emergent weed killers can be divided into selective (killing only weeds without harming crops) and non-selective (toxic to all plants). Common active ingredients include glyphosate, paraquat, and 2,4-D.
