## Abstracts

The global Post Processing System for Pouch Lithium-ion Battery market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The post-processing of the lithium battery is to activate, test and judge the quality of the battery after the battery is completed.

Specifically, it includes the formation, capacity division, and sorting of the battery cells. After post-processing, the battery cells can reach a usable state. Depending on the production process, the number of charging and discharging of the battery cell is not exactly the same, but at least twice, the first time is formation, and the second time is capacity division. Formation and capacity separation detection have a very significant impact on the performance of lithium batteries. The temperature and current accuracy control capabilities of formation equipment also determine the final performance parameters of the battery. The control and detection accuracy, long-term stability, and reliability of capacity separation equipment Safety and safety have a significant impact on the quality, production pass rate, production efficiency and safe production of the battery manufacturing process.
