The global Post Translational Modification Analysis Services market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Post-translational modification analysis services refer to the specialized services provided by scientific laboratories or companies that focus on the identification, characterization, and quantification of modifications occurring in proteins after their translation from mRNA. Proteins are not static entities and undergo various chemical modifications that can significantly impact their structure, function, stability, cellular localization, and interactions with other molecules.

Post-translational modifications (PTMs) include a wide range of biochemical processes, such as phosphorylation, glycosylation, acetylation, methylation, ubiquitination, and many more. These modifications play crucial roles in cellular signaling, gene expression regulation, protein folding, and degradation.

Post-translational modification analysis services are widely utilized in both basic research and applied fields. They contribute to the understanding of protein functions, disease mechanisms, drug discovery, biomarker identification, and personalized medicine.
