Abstracts

According to our (Global Info Research) latest study, the global Potassium Adipate?Dipotassium Adipate? market size was valued at US\$ 4.99 million in 2025 and is forecast to a readjusted size of US\$ 7.31 million by 2032 with a CAGR of 5.5% during review period.

Potassium adipate (CAS 19147-16-1) currently falls within the typical long-tail fine chemicals market, with a global market size of approximately US\$4.85 million and a compound annual growth rate of approximately 5.67%. Potassium adipate is a dipotassium salt of a dicarboxylic acid, formed through the neutralization reaction between adipic acid and potassium hydroxide; its molecular formula is $K_2C_6H_8O_4$, and it is fundamentally classified as a 'dicarboxylate salt' within the broader category of organic acid salts. Structurally, it consists of a linear six-carbon backbone ($-(CH_2)_4-$) linking two carboxylate groups ($-COO^-$), with two potassium ions (K^+) serving to balance the charge; consequently, it exhibits characteristics inherent to both inorganic salts (ionic properties) and organic molecules (structural properties). It serves as a weak-acid buffering salt and solution regulator, characterized by a moderate pKa range (offering buffering capacity around pH 4–6), high water solubility, and relatively mild coordination/complexation behavior.

The growth of potassium adipate is driven primarily by pharmaceutical R&D and demand within niche functional systems, rather than by large-scale industrial production volume. In terms of production capacity, there are no clearly defined, large-scale continuous manufacturing facilities globally; supply is dominated by a few small-to-medium-sized manufacturers—notably in India—that possess food and pharmaceutical certifications, as well as China's flexible contract manufacturing ecosystem. A significant

number of suppliers essentially operate as catalog-based traders or engage in synthesis-on-demand. Regarding definition and classification, it falls under the category of dicarboxylic acid salts within the broader class of organic acid potassium salts; it exhibits buffering properties, solubility, and a certain capacity for structural modulation, yet it has not been incorporated into mainstream food additive or pharmacopoeial excipient systems. In terms of application, its usage is concentrated primarily in pharmaceutical R&D—covering 'long-tail' scenarios such as buffering systems, crystallization process modulation, and formulation exploration—as well as in limited low-sodium food formulations and the modulation of specific solution systems. Conversely, in the materials and bulk industrial sectors, it has largely been supplanted by sodium adipate or other more established chemical systems. From a supply chain perspective, upstream production relies on adipic acid and potassium hydroxide, while downstream consumption is highly fragmented across CRO/CDMO firms, research laboratories, and small-scale functional applications, lacking any single concentrated end-use industry. Overall, the market for potassium adipate is not characterized by an absence of demand, but rather by its status as a quintessential niche chemical—defined by high substitutability, fragmented demand, and flexible supply. Consequently, the fundamental nature of this market lies not in scale expansion, but in maintaining a stable—albeit difficult-to-scale—presence within the pharmaceutical and specialized chemical sectors.
