Abstracts

The global Potassium Di-tert-butyl Phosphate market size is expected to reach \$ 17.76 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

In 2025, the global production of potassium di-tert-butyl phosphate was approximately 230 tons, with an average selling price of approximately US\$52/kg. The production capacity in 2025 was 280 tons, with an average gross profit margin of approximately 20-30%. Potassium di-tert-butyl phosphate is an organic phosphate salt composed of two tert-butyl groups, a phosphate group, and a potassium ion. Its molecular structure contains phosphorus, oxygen, carbon, hydrogen, and potassium. It is primarily used as a reagent in organic synthesis, possessing unique chemical reactivity and serving as an important intermediate.

The core upstream raw materials for potassium di-tert-butyl phosphate are tert-butanol (or tert-butyl halide) and phosphoryl chloride, which are used in esterification, hydrolysis, and salt formation reactions. Its downstream applications are highly focused on the high-end pharmaceutical and advanced materials research and development industries, where it serves as a crucial non-nucleophilic strong base and metal coordination precursor, specifically used in the synthesis of complex drug molecules (such as anticancer drugs and nervous system drugs) and high-performance organic electronic materials (such as OLED emissive layers and semiconductor transport materials).
