Abstracts

According to our (Global Info Research) latest study, the global Potassium Titanate Fiber market size was valued at US\$ 153 million in 2025 and is forecast to a readjusted size of US\$ 211 million by 2032 with a CAGR of 4.7% during review period.

In 2025, the global production of potassium titanate fibers was approximately 13,000 tons, with an average selling price of around US\$11,440 per ton. Single-line production capacity is approximately 500-1200 tons per year, with an average gross profit margin of about 20-30%. Potassium titanate fiber is a high-performance inorganic fiber reinforcement material, made from potassium titanate. It possesses extremely fine dimensions, high strength, high rigidity, heat resistance, thermal insulation, excellent wear resistance, and dielectric properties. It is mainly used to reinforce plastics, rubber, and other composite materials, and as a friction material in applications such as automotive brake pads, acting as a friction modifier. It is also used in electrical insulation and precision filtration.

The upstream raw materials for potassium titanate fibers mainly include titanium sources (such as titanium dioxide and metatitanic acid) and potassium sources (such as potassium carbonate and potassium hydroxide), as well as necessary mineralizers. Its downstream application industries are highly concentrated in the friction materials field (as the core reinforcing fiber in automotive brake pads), and it is widely used in high-performance engineering plastics (for reinforcement and heat resistance modification in automobiles and electronic components), special sealing and thermal insulation materials (for industrial equipment and pipelines), and also as a potential material for ceramic coatings in lithium-ion battery separators in the new energy sector.
