## Abstracts

According to our (Global Info Research) latest study, the global Power Device Heat Sink Material market size was valued at US\$ 1214 million in 2025 and is forecast to a readjusted size of US\$ 1971 million by 2032 with a CAGR of 6.8% during review period.

Power Device Heat Sink Material refers to the material platforms and semi-finished components that realize package/module-level thermal paths for power devices (Si IGBT/MOSFET, SiC MOSFET/diodes, GaN devices), covering power module baseplates, heat spreaders for ceramic/metal/plastic packages, and spacers (often for double-side cooling or stack height control). Engineering selection is driven by the coupled targets of high thermal conductivity, CTE matching, and scalable manufacturability/finishing. The mainstream material set includes Cu/Al metals, controlled-CTE refractory composites (Cu-Mo, Cu-W, WCu), Al-based MMCs (notably Al-SiC, and premium Al-diamond), and ultra-high-k composites (e.g., Ag-diamond). Denka explicitly defines ALSINK as an Al-based MMC consisting of Al-SiC and ceramics, highlighting low thermal expansion and high thermal conductivity.

Differentiation is dominated by thermo-mechanical reliability under power cycling: CTE mismatch drives stress into solder/braze layers and ceramic substrate interfaces, accelerating fatigue and warpage. On the baseplate side, Vincotech notes that AlSiC baseplates are often used in traction instead of copper, and frames CTE and thermal resistance as key factors in the trade-off. On the heat-spreader/spacer side, A.L.M.T. positions CPC™ (Cu/Cu-Mo/Cu laminate) as adjustable-CTE and mass-producible (including stamping), and describes Ag-diamond heat spreaders with thermal conductivity above 600 W/m·K and available Ni/Au/Ag plating—illustrating how plating/finishing is integral to assembly compatibility and reliability. Plansee highlights

WCu and refractory-metal solutions for electronics thermal management and states that the combination of thermal conductivity and CTE makes WCu well suited for SiC and GaN applications, aligning with base plate / heat spreader use cases.

Demand clusters into (i) high-reliability power modules (traction inverters, EV powertrain/charging, industrial drives, renewables/grid) where baseplate/substrate stack reliability is paramount; (ii) package heat spreaders for ceramic/metal/plastic power packages where CTE-matching mitigates stress; and (iii) spacers enabling double-side cooling and mechanical tolerance control. The competitive landscape is multi-tiered—materials platform owners (AlSiC, CuMo/CuW/WCu, diamond composites), precision fabricators/platers, and module/system integrators—with barriers built on property control, scale manufacturing, and validated reliability datasets. Technology trends are moving in parallel: higher power density pushes both tighter CTE control (AlSiC and refractory composites) and higher-k solutions (diamond composites) while system integration pushes double-side cooling and reduced/removed baseplate architectures; Vincotech's recent publications explicitly discuss baseplate-less modules approaching or outperforming conventional copper-baseplate modules.
