According to our (Global Info Research) latest study, the global Power EMI Filters market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Power supply filter is a filter circuit composed of capacitors, inductors and resistors, a passive bidirectional network, one end of which is the power supply and the other end is the load. The principle of the power filter is a kind of impedance adaptation network: the greater the impedance adaptation between the input and output sides of the power filter and the power supply and load sides, the more effective the attenuation of electromagnetic interference. The filter can effectively filter the frequency point of a specific frequency in the power line or the frequency other than the frequency point to obtain a power signal of a specific frequency, or eliminate the power signal of a specific frequency.
