Abstracts

The global Power and Distribution Transformer Cores market size is expected to reach \$ 14576 million by 2032, rising at a market growth of 5.6% CAGR during the forecast period (2026-2032).

Power and Distribution Transformer Cores are magnetic circuit assemblies used in power and distribution transformers to provide a low-reluctance path for alternating magnetic flux. They are primarily manufactured from grain-oriented electrical steel (GOES/CRGO) through lamination stacking or winding processes, while iron-based amorphous alloy is increasingly adopted in high-efficiency distribution transformers. Manufacturing processes typically include slitting, cut-to-length processing, step-lap cutting and stacking, winding, annealing, clamping and core assembly. The proposed market scope covers power-frequency transformer cores used by utilities, industrial facilities, renewable energy projects and other power infrastructure, while excluding ferrite and other high-frequency electronic transformer cores. In 2025, global Power and Distribution Transformer Cores production reached approximately 2772.43 Kilotons. The upstream segment primarily consists of grain-oriented electrical steel (GOES/CRGO), iron-based amorphous alloy ribbon, insulation coatings, clamping components and structural materials. GOES represents the most important raw material for conventional power transformer cores, and the availability and pricing of high-permeability, low-loss and thin-gauge GOES significantly affect core manufacturing costs.

The global power and distribution transformer core market is currently benefiting from a strong investment cycle. Demand is being supported not only by replacement of aging grid assets, but also by transmission and distribution expansion, renewable energy interconnection, rapidly increasing power demand from AI and data centers, industrial

electrification and increasingly stringent transformer efficiency requirements. The U.S. Department of Energy has highlighted growing transmission requirements associated with data centers, large industrial loads and manufacturing expansion, while distribution transformer supply chains continue to experience capacity constraints.
