Abstracts

The global Power over Ethernet Transformer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Power over Ethernet transformers usually include two parts: data side and power side. The data side is used to connect to the network port of the Ethernet device and is responsible for transmitting data signals. It simplifies equipment installation and wiring, increases flexibility and convenience, and reduces system cost and complexity. At the same time, Ethernet power supply transformers also need to meet relevant technical specifications and standards to ensure the safety, reliability and performance stability of power supply.

A Power over Ethernet transformer, also known as a PoE transformer, is a transformer specifically used for power supply to Ethernet devices. The Ethernet power supply transformer is mainly used to transmit power and data signals on the same Ethernet cable, providing network equipment with the function of transmitting data and supplying power at the same time. It enables powering devices without the need for additional power lines by converting AC power into DC power suitable for the needs of network devices and delivering it to the target device.
