The global Power Plants In-Service Inspection Service market size is expected to reach \$ 8567 million by 2032, rising at a market growth of 5.3% CAGR during the forecast period (2026-2032).

Power Plants In-Service Inspection Service refers to the periodic or non-destructive testing, assessment, and monitoring activities conducted by professional organizations on critical equipment and components during operation or shutdown maintenance of power generation facilities, in accordance with relevant regulations and standards. This service primarily targets high-temperature and high-pressure components in nuclear power plants, thermal power plants, and hydropower plants, such as reactor pressure vessels, steam pipes, turbine rotors, and water turbines. It utilizes non-destructive testing technologies such as ultrasonic, radiographic, and eddy current testing to promptly detect potential defects such as material aging, fatigue cracks, and corrosion thinning. Through systematic in-service inspections, the safety status and remaining service life of equipment are assessed, providing technical support for safe operation, maintenance decisions, and life extension assessments of the units. This service is a crucial line of defense for ensuring the long-term safe and stable operation of power plants.
