The global Power Station Insulator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Power station insulators are an important component in power systems, used to support air insulation between transmission lines and isolation conductors and grounded metal structures. Its main function is to support and fix wires, insulate wires, prevent leakage, etc. in high-voltage power systems to ensure the safe operation of the power system. Power station insulators are usually composed of insulating materials, metal parts and grounding devices. They can be divided into many types according to their shapes and uses, such as series insulators, suspension insulators, tensile insulators, cable terminal insulators, etc. Power station insulators are generally made of ceramics, fiberglass, rubber, etc., which have the characteristics of high temperature resistance, corrosion resistance, fatigue resistance, etc., and are widely used in transmission lines, substations, power plants and other places in power systems.
