## Abstracts

The global Power Supervisory Control and Data Acquisition Software market size is expected to reach \$ 1115 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

Power Supervisory Control and Data Acquisition Software is an automated software platform for real-time monitoring, control, and management of power system operations. It collects electrical parameters such as voltage, current, power, and switch status from substations, distribution lines, power plants, and power consumers through remote terminal units, intelligent electronic devices, and communication networks. These parameters are then visualized, stored, and used for event alarms and trend analysis in a host computer system. The software features remote control, telemetry, remote signaling, and remote adjustment capabilities, and supports integration with protection devices, automatic control equipment, and dispatching systems to achieve rapid fault location and recovery. Widely used in power grid dispatching, industrial power distribution, rail transit, and data centers, it is a core tool for ensuring the safe, stable, and economical operation of power systems and is gradually evolving towards intelligent and cloud-edge collaborative architectures.

The global development of power supervisory control and data acquisition software exhibits a regionally differentiated pattern: North America is primarily driven by grid modernization, extreme weather response, and replacement of outdated infrastructure, resulting in a highly mature market; Europe focuses on the grid stability challenges brought about by the high proportion of renewable energy grid integration, leading to strong demand for SCADA systems supporting IEC 61850 and distributed energy access; the Asia-Pacific region, driven by new energy investment, smart grid

construction, and industrialization, has become the fastest-growing regional market globally. Future trends include cloud and SaaS deployment, AI-driven fault prediction and health management, digital twin simulation, and the deep integration of edge computing and lightweight monitoring solutions. Key obstacles include rising cybersecurity risks in industrial control systems, poor compatibility in retrofitting legacy systems, a shortage of skilled personnel, and interoperability issues between devices from different vendors. Dynamically, the deepening application of the IEC 61850 standard, coupled with the voltage and frequency stability monitoring needs arising from renewable energy grid integration, is spurring the development of new real-time data acquisition solutions.
