Abstracts

Power supply filter is a filter circuit composed of capacitors, inductors and resistors, a passive bidirectional network, one end of which is the power supply and the other end is the load. The principle of the power filter is a kind of impedance adaptation network: the greater the impedance adaptation between the input and output sides of the power filter and the power supply and load sides, the more effective the attenuation of electromagnetic interference. The filter can effectively filter the frequency point of a specific frequency in the power line or the frequency other than the frequency point to obtain a power signal of a specific frequency, or eliminate the power signal of a specific frequency.

This report studies the global Power Supply Filters production, demand, key manufacturers, and key regions.
