## Abstracts

The global Power Type Optocoupler market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Optocouplers, also known as optoisolators, are also known as optocouplers. Photocouplers transmit electrical signals using light as a medium. It has a good isolation effect on input and output electrical signals, so it is widely used in various circuits. At present, it has become one of the most diverse and widely used optoelectronic devices. Optical couplers generally consist of three parts: light emission, light reception, and signal amplification. The input electrical signal drives the light-emitting diode (LED) to emit a certain wavelength of light, which is received by the photodetector and generates a photoelectric current. After further amplification, it is output. This completes the conversion of electricity, light, and electricity, thereby playing the role of input, output, and isolation. Due to the mutual isolation between the input and output of the optocoupler, and the unidirectional transmission of electrical signals, it has good electrical insulation and anti-interference capabilities. Photocoupler is a semiconductor optoelectronic device that encapsulates light-emitting devices and photosensitive devices in the same shell, and transmits electrical signals through the conversion of electricity to light to electricity. Among them, light-emitting devices are generally light-emitting diodes. There are many types of photosensitive devices, including photodiodes, photosensitive transistors, photoresistors, and optoelectronic thyristors. Photocouplers can be combined into many series of optocouplers by different types of light-emitting devices and photosensitive devices according to different requirements.
