According to our (Global Info Research) latest study, the global Power Ultrasonic Transducers market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

A power ultrasonic transducer is a device that uses the electrostrictive effect and inverse piezoelectric effect of piezoelectric materials (such as piezoelectric ceramics) to convert electrical energy into mechanical energy (ultrasonic vibration) or mechanical energy into electrical energy. It generates ultrasonic vibrations through the mechanical deformation of piezoelectric materials when an electrical signal is applied, and is widely used in industrial and laboratory environments that require high-power ultrasonic energy. This transducer is usually used in applications that require high-intensity ultrasonic waves, such as industrial cleaning, welding, crushing, emulsification, etc.
