Powered phacoemulsifier is a medical device that uses ultrasonic energy to perform cataract surgery. It transmits ultrasonic energy to the emulsification needle by generating high-frequency vibration, and then emulsifies and removes the cataract lens. This device has been widely used in early cataract surgery and has gradually improved with the continuous development of technology. The working principle of powered phacoemulsifier is mainly based on the cavitation effect and mechanical vibration of ultrasound. When ultrasonic energy is transmitted to the emulsification needle, great stress will be generated at the end of the needle, which is enough to break the lens tissue. At the same time, the emulsification needle also has a suction function, which can remove the broken lens tissue out of the eye.

Powered phacoemulsifier has been widely used in early cataract surgery and has gradually improved with the continuous development of technology. However, with the continuous advancement of modern medical technology, suction-type phacoemulsifiers have gradually emerged and gradually replaced the market position of some powered phacoemulsifiers with their low energy and high negative pressure characteristics.

Despite this, powered phacoemulsifiers still have their unique advantages and application value in certain specific cases.
