Abstracts

According to our (Global Info Research) latest study, the global Prasterone market size was valued at US\$ 51.56 million in 2025 and is forecast to a readjusted size of US\$ 82.38 million by 2032 with a CAGR of 7.0% during review period.

Prasterone, the synthetic equivalent of endogenous dehydroepiandrosterone (DHEA), has emerged as a key player in the field of hormone-based therapies. Traditionally recognized for its role in alleviating menopausal symptoms?particularly moderate to severe dyspareunia?it is increasingly being investigated for broader applications including anti-aging, cognitive enhancement, and even immune modulation. With its ability to convert locally into estrogens and androgens, prasterone represents a unique therapeutic modality with minimal systemic exposure, garnering interest from both the medical and wellness communities.

Research institutions and pharmaceutical companies are increasingly exploring prasterone?s potential in areas beyond its current indications, including neuroprotection and metabolic modulation. This diversification is expected to broaden the market scope over the next several years.

In developed markets like the United States and Europe, prasterone is gaining traction as part of a broader trend toward hormone replacement therapies. The aging population?s growing need for treatments that address not only physical but also sexual and cognitive declines is fuelling this demand.

With DHEA levels naturally declining after age 30?more rapidly in women?the need for interventions that restore hormonal balance is becoming more pronounced. This demographic shift is a primary market driver for prasterone-based therapies.
