Abstracts

According to our latest research, the global Pre Cure Tire Retreading market size will reach USD 171 million in 2031, growing at a CAGR of 1.4% over the analysis period.

Pre-cure tire retreading is a process where the new tread material, which has already been cured (vulcanized) in a factory, is applied to a worn tire casing. In this method, the tread is made into pre-formed strips or a full tread that has been cured before being attached to the tire. The worn tire casing is cleaned and prepared, and then the pre-cured rubber tread is applied using an adhesive or bonding agent.

Once the new tread is placed, the tire is then subjected to heat and pressure to ensure a strong bond between the tread and the casing, but no further curing of the rubber is needed since the tread has already been vulcanized.
