## Abstracts

The global Pre-Emergent Weed Preventer market size is expected to reach \$ 12499 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

Global shipments of pre-emergent weed preventers are projected to reach approximately 1.1 million tons by 2025. The average transaction price for mainstream active ingredient products used in corn, soybeans, rice, and orchard horticulture is estimated at around US\$7,500 per ton. This price range primarily corresponds to mainstream field crop formulations such as glyphosate alternatives to soil sealants, amides, triazines, and dinitroanilines, excluding high-end bio-based or specialty horticultural microcapsule slow-release products. In typical field crop cultivation, 2?5 kg of active ingredient per hectare is typically used for pre-emergence treatment. In large-scale corn or soybean farms, approximately one large boom sprayer is deployed for every 300?800 hectares of operating area. The cost of pre-emergence sealants accounts for approximately 8%?15% of the total planting input per season. Major demand sources include major corn and soybean producing areas, cotton planting bases, large-scale rice cultivation areas, orchard and nut orchard management systems, and urban greening and landscaping maintenance systems. North America and Latin America together account for approximately 48% of demand, with the United States and Brazil showing stable demand in chemical control systems with genetically modified crops. The Asia-Pacific region (China, India, and Southeast Asia) has seen significant growth driven by food security policies and the expansion of large-scale planting. Pre-emergent weed preventers are pesticide formulations applied after crop sowing but before weeds emerge. They inhibit weed seed germination or seedling growth by forming a chemical barrier on the soil surface. Their core function is to block weed cell division and growth through root absorption or embryonic inhibition mechanisms, reducing competitive pressure in the field from the source. Compared to

simple post-emergence weed control, pre-emergence treatment offers advantages such as reducing early weed competition, reducing the number of subsequent re-sprays, and minimizing manual intervention. Its agricultural engineering positioning is not simply that of a 'chemical weed control product,' but rather a fundamental unit in large-scale agricultural systems that achieves 'reduced labor and increased efficiency + stable yield + resistance management.' With rising global agricultural labor costs and the intensifying problem of resistant weeds, this product is evolving from a 'seasonal routine input' to a 'core tool for resistance management and stable yield management.'
