## Abstracts

The global Pre-marital and Pre-Pregnancy Genetic Testing Service market size is expected to reach \$ 2273 million by 2032, rising at a market growth of 5.1% CAGR during the forecast period (2026-2032).

Pre-marital and pre-pregnancy genetic testing service is a medical health assessment service based on high-throughput gene sequencing and molecular genetics technologies. Primarily targeting individuals planning marriage or trying to conceive, it systematically analyzes the genetic information of individuals or couples to screen for the risk of carrying common and rare genetic diseases, chromosomal abnormalities, and related genetic variations. This service not only includes gene testing itself but also typically combines genetic risk assessment, professional medical interpretation, and genetic counseling to help individuals fully understand potential genetic risks and optimize their fertility decisions. Its core value lies in identifying the risk of hereditary disease transmission in advance, enabling early prevention and control of birth defects, and promoting the scientific and individualized management of reproductive health based on the concept of eugenics.

With the continuous improvement of precision medicine and the significant increase in public awareness of health management, the market demand for pre-marital and pre-pregnancy genetic testing service is continuously growing, gradually transforming from a medical auxiliary examination to a proactive health management tool. Driven by rapid advancements in gene sequencing technology and continuously decreasing testing costs, the accessibility of this service is constantly improving, expanding its application scenarios from high-end medical institutions to general reproductive health management systems. Meanwhile, policy support from various countries for birth defect

prevention and control and improving population health has further promoted the development of this field. In the future, this service will be deeply integrated with genetic counseling, assisted reproductive technology, maternity insurance, and digital health record systems to form a comprehensive reproductive health management system covering the entire lifecycle of 'testing—assessment—intervention—follow-up.' Furthermore, with the development of AI-assisted gene interpretation and big data genetic risk models, the interpretability and accuracy of test results will be further improved, driving the industry towards standardization, intelligence, and universal accessibility.
