Pre and Post Vacuum Class B Autoclaves are types of sterilization equipment used in medical and laboratory settings. Class B autoclaves use a combination of vacuum, pressure, and steam to sterilize instruments, devices, and materials. Pre-vacuum cycles remove air from the chamber before sterilization begins, while post-vacuum cycles help to remove any remaining moisture from the load after sterilization is complete. The advantage of using a Class B autoclave is that it can sterilize a wider variety of items than other autoclave types, including porous items like textiles and wrapped materials. The pre- and post-vacuum cycles help to ensure thorough and effective sterilization, making Class B autoclaves a popular choice in healthcare facilities and research laboratories where sterility is critical.
