Abstracts

According to our (Global Info Research) latest study, the global Precious Metal Brush Material market size was valued at US\$ 375 million in 2025 and is forecast to a readjusted size of US\$ 494 million by 2032 with a CAGR of 4.1% during review period.

Precious metal brush materials refer to sliding electrical contact components made from noble metals such as gold, silver, platinum, palladium, and their alloys. They are characterized by very low contact resistance, excellent electrical and thermal conductivity, superior oxidation and corrosion resistance, and good wear resistance. These materials ensure stable and reliable signal transmission and current conduction under conditions of low current, low voltage, or harsh environments (e.g., high vacuum, extreme temperatures, strong corrosion), minimizing contact failure and electrical noise. They are primarily used in brushes, slip rings, and contacts for precision instruments, aerospace systems, high-end relays, high-performance motors, and critical electronic components.

In 2025, the global production of precious metal brush materials reached 12.55 tons, with an average selling price of US\$29 per gram and a capacity of approximately 14.3 tons. The industry's gross profit margin was approximately 10%-20%. Cost structure: Due to the high price of precious metals, direct materials account for over 95% of the cost. Industry chain: Upstream consists of precious metal raw materials such as silver, gold, platinum, and palladium, while downstream is the precision motor industry.
