According to our (Global Info Research) latest study, the global Precision Agriculture Robot market size was valued at USD 3301.9 million in 2023 and is forecast to a readjusted size of USD 23130 million by 2030 with a CAGR of 32.1% during review period.

Precision Agriculture (PA) is a farming management concept based upon observing, measuring and responding to agriculture. It was born in early 1990s for introduction of GPS guidance for tractors. Now it is a dynamic industry that mentioned lots of technologies, such as ecological based principles, plant genetics, technological advances in planting and application equipment and plant and soil sensors, and knowledge to vary management, to improve system efficiency, resilience, and adaptability.

Farmers have always been diligent data collectors, knowing approximately what each acreage yields or how much milk an individual cow produces. But with the complex data collecting devices of today's world, agriculture is in the midst of a high-tech revolution—particularly in the area of precision farming.

Farmers can use the same “big data” tools that are integrated into other industries. Things like drones that communicate with satellites to collect data while soaring over a field. The internet of things era means just about anything in our lives can be linked to a WiFi connection and the same applies for farming. For example, Wifi-enabled moisture sensors can help farmers conserve water by only watering parts of the field that need it most. Cow tags can be linked to GPS or even “Fitbit-like” devices to track their vitals remotely. Most machines can be programmed to use machine-learning; for example,

fertilizer application equipment can be trained to “see” a field and only spray plants that need a boost, saving farmers product and money.
