According to our (Global Info Research) latest study, the global Precision Digital Medical Service Platform market size was valued at US\$ 1550 million in 2025 and is forecast to a readjusted size of US\$ 3358 million by 2032 with a CAGR of 11.8% during review period.

A precision digital healthcare service platform refers to a comprehensive platform that utilizes advanced technologies such as big data, artificial intelligence, and genomics to integrate and analyze multi-dimensional data from patients, including clinical, genetic, and lifestyle information. It provides support for personalized disease prevention, diagnosis, treatment, and health management. These platforms aim to help healthcare professionals develop treatment plans that better meet individual needs through precise information and analysis, thereby improving the accuracy and effectiveness of medical services and achieving the goal of precision medicine.

The downstream market for precision digital healthcare service platforms primarily targets hospitals and specialized medical institutions, regional medical management departments, commercial insurance companies, physical examination and health management institutions, chronic disease management companies, and pharmaceutical and medical device companies that need to improve diagnostic efficiency, patient management quality, and cost control through digital tools. These downstream customers typically purchase services such as intelligent follow-up systems, AI-assisted diagnostic platforms, patient lifecycle management systems, data interconnection platforms, telemedicine systems, and drug efficacy tracking tools. Because platform-based businesses primarily focus on software, SaaS, and data analysis, they have high initial development costs but low marginal costs, resulting in relatively high overall gross

profit margins, generally in the 45%-70% range. Gross margins are highest for SaaS subscriptions and data services, while those combined with offline physician services or highly customized projects are slightly lower.

The precision digital medical service platform is a medical system that integrates cutting-edge technologies such as big data analysis, artificial intelligence, genomics and the Internet of Things. It aims to integrate and analyze multi-source data of patients to provide support for personalized disease prevention, diagnosis, treatment and health management. Through these platforms, medical institutions and professionals can understand patients' health conditions more accurately, develop targeted treatment plans, improve the efficiency and effectiveness of medical services, thereby promoting the realization of precision medicine and improving patients' overall health experience.
