## Abstracts

The global Precision Electronic Balance Instrument market size is expected to reach \$ 7177.1 million by 2029, rising at a market growth of 5.4% CAGR during the forecast period (2023-2029).

Precision electronic balance refers to an instrument used to measure physical quality. The reading is accurate, generally up to  $\pm 0.1$  mg. It is usually surrounded by a frame cover to ensure accuracy. It is one of the commonly used weighing instruments in chemical laboratories. People call a balance that uses electromagnetic force to balance the gravity of an object to be called an electronic balance. It has the advantages of accurate and reliable weighing, fast and clear display, automatic detection system, simple automatic calibration device and overload protection device, and easy to use. There are mainly two types of top loading and bottom loading. The top-loading electronic balance is the earliest electronic balance developed, which is manufactured according to the principle of magnetic force compensation.

Electronic balances usually use strain gauge sensors, capacitive sensors, electromagnetic balance sensors, and strain gauge sensors, which are simple in structure and low in cost, but have limited precision and cannot achieve very high precision at that time; capacitive sensors have fast weighing speed and high cost performance, but can not achieve very high precision; electronic balance using electromagnetic balance sensor. It is characterized by accurate and reliable weighing, quick and clear display, automatic inspection system, simple automatic calibration equipment and overload protection equipment.
