According to our (Global Info Research) latest study, the global Precision Porous Bearing market size was valued at US\$ 3498 million in 2024 and is forecast to a readjusted size of USD 4313 million by 2031 with a CAGR of 3.0% during review period.

Precision porous bearing is a microporous structure bearing manufactured through powder metallurgy technology, with an internal porosity of usually 15-30%, pre impregnated with lubricating oil to achieve self-lubricating characteristics. During operation, the frictional heat generated by the rotation of the shaft raises the oil temperature, causing lubricating oil to seep out of the pores and form an oil film; After stopping operation, the oil is sucked back into the pores due to capillary action, achieving lifelong maintenance free operation.
