## **Abstracts**

The premature rupture of membranes (PROM) is a condition that occurs in pregnancy. It is defined as the breakage of the amniotic sac, which generally takes place one or two hours before the onset of contractions or labor. The early breakage of the membrane, i.e. before 37 weeks of gestation, can lead to inevitable abortion. Additionally, if the rupture of the amniotic sac resulting in fluid leakage is not detected on time, infections or other complications may occur in the fetus or the mother. Leakage or a sudden discharge of fluid from the vagina is the only symptom of PROM. The exact cause of PROM is largely unknown. However, researchers believe that bacterial production in the lower genital tract that travels to the membrane can lead to a leak.

Scope of the Report:

Rise in the incidence of pre- and post-natal complications is anticipated to drive The global premature rupture of membranes testing market.

North America dominates The global market. The region is projected to account for a significant share of The global premature rupture of membranes testing market during the forecast period, due to an increase in the number of preterm births. Moreover, many independent studies have revealed that nearly 10% of babies born in the U.S. are born prematurely, and the rate is increasing.
