Abstracts

The global Preoperative Bathing Solution market size is expected to reach \$ 347 million by 2032, rising at a market growth of 6.7% CAGR during the forecast period (2026-2032).

Preoperative Bathing Solutions are antiseptic preparations used by patients prior to surgery to reduce the microbial load on the skin, specifically targeting the reduction of resident and transient flora (such as *S. aureus*) to lower the risk of Surgical Site Infections (SSIs). These solutions are typically formulated with 2% or 4% Chlorhexidine Gluconate (CHG) or povidone-iodine. They are available in various forms, including liquid soaps for showering, impregnated cloths (wipes), and single-use applicators. The upstream segment includes raw material suppliers of chlorhexidine gluconate, surfactants, emollients, non-woven fabrics, and sterile packaging. The midstream segment encompasses formulation, impregnation, sterilization, and packaging performed by pharmaceutical and medical device manufacturers. The downstream segment comprises distribution channels including hospital surgical departments, outpatient surgical centers, e-commerce platforms, and retail pharmacies, serving end-users in pre-operative patients.

The global average selling price for preoperative bathing solutions is approximately US\$6.90 per unit (referring to a typical single-patient application pack or a 4 oz bottle), with annual sales volume reaching approximately 31 million units in 2025. The industry maintains gross margins between 30% and 45%.

The global preoperative bathing solutions market is experiencing steady growth, driven primarily by the increasing volume of surgical procedures worldwide and the stringent implementation of infection control protocols. Healthcare providers are shifting from

traditional soap and water or povidone-iodine scrubs toward 2% chlorhexidine gluconate (CHG) solutions, which offer residual antibacterial activity and broader coverage against gram-positive organisms.

A notable trend reshaping the market is the shift toward CHG-impregnated cloths. Unlike traditional liquid soaps that may be rinsed off improperly, pre-moistened wipes ensure standardized application, controlled dosage, and reduced risk of dilution. This product form is particularly popular in home pre-operative preparation settings, where patient compliance is critical. Additionally, the development of low-irritation formulations with emollients is expanding adoption among patients with sensitive skin, reducing the incidence of contact dermatitis caused by high-concentration CHG.

The economic burden of hospital-acquired infections is a major driver for this market. With Surgical Site Infections prolonging hospital stays, reimbursement policies in major markets are increasingly incentivizing bundled preventive measures, making preoperative bathing with CHG a standard of care in many orthopaedic and cardiac surgery protocols.
