According to our (Global Info Research) latest study, the global PreScission Protease market size was valued at US\$ 146 million in 2024 and is forecast to a readjusted size of USD 329 million by 2031 with a CAGR of 12.2% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

PreScission Protease is a fusion protein composed of human rhinovirus (HRV) type 14 3C protease and GST. The protease can specifically recognize the short peptide Leu-Glu-Val-Leu-Phe-Gln-Gly-Pro at low temperature (4°C) and perform enzymatic cleavage between Gln and Gly amino acid residues. The recognition and cleavage of the substrate depends not only on the primary structure of the fusion protein but also on the secondary and tertiary structures of the fusion protein. It can specifically separate the GST tag of the fusion protein with enzyme substrate recognition peptide sequence expressed by vectors such as the pGEX-6P series.

PreScission protease is a new protein degradation technology developed and is an extension of the PROTAC (targeted protein degradation) technology platform. It activates the conditional protease system to achieve precise degradation of targeted proteins in specific tissues or cell environments. In recent years, with the development of precision medicine and protein degradation technology, PreScission protease is gradually becoming a hot spot in drug research and development, especially in the fields of anti-tumor and autoimmune diseases. In the future, its synergistic application with other protein degradation platforms (such as Molecular Glue, LYTAC, etc.) may

further promote the diversity and target coverage of targeted drugs.
