The global Pressed Copper Foil market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Pressed Copper Foil is a type of copper foil that is made by a process of pressing or rolling copper into thin sheets or strips. The copper is typically highly pure and has a uniform thickness that is achieved through the pressing process. Pressed Copper Foil is commonly used as a material for electronic devices and circuit boards, where it provides electrical conductivity, corrosion resistance, and thermal stability. It can also be used in various other applications, such as in architecture and construction, for its aesthetic properties and durability. The thickness of Pressed Copper Foil can vary depending on the intended use, but it is typically measured in micrometers or mils.
