## Abstracts

According to our (Global Info Research) latest study, the global Pressure I/P Transducers market size was valued at US\$ 926 million in 2025 and is forecast to a readjusted size of US\$ 1409 million by 2032 with a CAGR of 6.2% during review period.

In 2025, global Pressure I/P Transducer output reached about 9 million units and global capacity of around 11 million units. The average price is about USD 100 per unit, with gross margins near 32%. A Pressure I/P (Current-to-Pressure) Transducer is an electro-pneumatic device that converts an electrical current signal, from a PLC, DCS, or process controller, into a proportional pneumatic pressure output, for controlling pneumatic actuators, control valves, dampers, and industrial automation systems. These transducers are widely used in process industries because many legacy and hazardous-area control systems still rely on pneumatic actuation for safety and reliability. The supply chain starts with upstream raw materials and components such as aluminum or stainless steel housings, pressure sensors, piezoelectric or electromagnetic force-balance mechanisms, precision nozzles, flappers, electronic circuits, coils, diaphragms, seals, pneumatic fittings, and semiconductor control chips. Midstream manufacturers design and assemble the I/P transducers, perform calibration, explosion-proof or intrinsically safe certification, and integrate digital communication protocols such as HART or Fieldbus in advanced models. Downstream distribution involves industrial automation suppliers, valve manufacturers, EPC contractors, and system integrators, while end users include oil & gas, chemical processing, power generation, water treatment, pharmaceuticals, pulp & paper, food processing, mining, and industrial manufacturing sectors where precise pneumatic process control is required.
